Lab # : 4; Lab Name : Hive 2 - a few features; Subject Name : Information Storage and Retrieval; Week #: 4; Lab Duration : 20 to 30 mins

Intro

In this lab, we will go over a few more Hive features and commands, which are useful for managing data in Hive. We will go over the following features:

- Partitioning a Table
- Bucketing a Table
- Check Storage format of a Hive table
- Hive on MR vs Tez
- Hive Views
- User Defined Functions

Here are a few points to get to know Hive:

- Hive can organize data in tables in partitions based on chosen column/s in a table. Partitioning a table creates multiple HDFS folders for the respective partitioned data.
- Buckets in a hive table are individual files physically.
- Bucketing can be done along with Partitioning on Hive tables and even without partitioning.
- Hive lets checking metadata of a Hive table
- Hive on Tez is a new feature in Hive, which runs faster than Hive alone on MR.
- Hive views could be created to filter data. Even UDF could be applied to views.
- For creating analytical operators, you can create custom User Defined Functions in java, python and other languages.

NOTE: All the codes in labs are samples only. You can always use variations of the code as applies. The intention of these labs, are to get you familiar with these concepts at physical level. However, these are vast areas to learn within a few minutes.

Let’s go!

Step-1.PARTITIONED Table

Partitions are horizontal slices of data, which allow large sets of data to be segmented into more manageable blocks. Partitioning creates folder at HDFS level.

```
CREATE TABLE Web_Session_Log_Partitioned

(

DATETIME varchar(500), USERID varchar(500), SESSIONID varchar(500),

PRODUCTID varchar(500), REFERERURL varchar(500))

COMMENT 'This is the Twitter streaming data'

PARTITIONED BY(DT STRING)

ROW FORMAT DELIMITED

FIELDS TERMINATED BY '\t'

STORED AS TEXTFILE;
```

Now, let’s load data into the same table.

-- from the table you created in your previous lab; in case you don’t have, you need to recreate.

```
FROM Web_Session_Log

INSERT OVERWRITE TABLE Web_Session_Log_Partitioned PARTITION
(DT="2014-01-02 00:00:06 GMT") SELECT *;
```

Now, please check the folder and files for the table in HDFS. You might have to drill down to locate the folder.

Step-2. Bucketing a table

Bucketing is a technique that allows you to cluster or segment large sets of data to optimize query performance.

```
hive>
CREATE TABLE Web_Session_Log_Bucket
    (DATETIME varchar(500),
    USERID varchar(500),
    SESSIONID varchar(500),
    PRODUCTID varchar(500),
    REFERERURL varchar(500))
    COMMENT 'This is the Web Session Log data' PARTITIONED BY( PRDID
STRING)
    CLUSTERED BY(USERID) INTO 2 BUCKETS ROW FORMAT DELIMITED
    FIELDS TERMINATED BY '\t'
STORED AS TEXTFILE;
```

```
set hive.enforce.bucketing = true;
```

```
FROM Web_Session_Log -- the table you created in your previous lab
INSERT OVERWRITE TABLE Web_Session_Log_Bucket PARTITION
(PRDID="/product/MT65XF2YA")
SELECT *;
```

Now, please check the folder and files for the table in HDFS. Do you see any difference? Please refer to Hive documentation, to further read on bucketing and partitioning as these are very much used in any hive implementation.

Step-3. Let's check an existing table about it's table properties.

```
describe Web_Session_Log;
```

Here is the sample output:

```
…….
datetime varchar(500)
userid varchar(500)
sessionid varchar(500)
```

```
productid varchar(500)
refererurl varchar(500)
Time taken: 0.111 seconds, Fetched: 5 row(s)
```

Here is another way to do the same for more details:
describe **formatted** Web_Session_Log;

```
col_name data_type comment
datetime varchar(500)
userid varchar(500)
sessionid varchar(500)
productid varchar(500)
refererurl varchar(500)
Detailed Table Information
Database: default
Owner: ubuntu
CreateTime: Thu May 28 06:11:32 UTC 2015
LastAccessTime: UNKNOWN
Protect Mode: None
Retention: 0
Location: hdfs://ip-10-85-31-243.eu-west-
1.compute.internal:8020/user/hive/warehouse/web_session_log
Table Type: MANAGED_TABLE
Table Parameters:
COLUMN_STATS_ACCURATE true
numFiles 1
numRows 0
rawDataSize 0
totalSize 4513792
transient_lastDdlTime 1432793495
Storage Information
SerDe Library: org.apache.hadoop.hive.serde2.lazy.LazySimpleSerDe
InputFormat: org.apache.hadoop.mapred.TextInputFormat
OutputFormat: org.apache.hadoop.hive.ql.io.HiveIgnoreKeyTextOutputFormat
Compressed: No
Num Buckets: -1
Bucket Columns: []
Sort Columns: []
Storage Desc Params:
field.delim \t
serialization.format \t
```

```
Time taken: 0.1 seconds, Fetched: 36 row(s)
```

Please notice above Input and Output formats. These are all customizable as well.

Step-4. Let's join two tables.

In Hive, you can do various kinds of joins like, inner join, left outer join, right outer join, etc.

Here is an example query. You could create two tables of your choice and join them.

```
SELECT
Web_Session_Log.DATETIME,Web_Session_Log.USERID,User_Data.FIRSTNAME,U
ser_Data.LASTNAME,User_Data.LOCATION,Web_Session_Log.PRODUCTID,Web_
Session_Log.REFERERURL from Web_Session_Log JOIN User_Data ON
(User_Data.USERID=Web_Session_Log.USERID);
```

Step-5. Hive on Tez.

Tez is a new application framework built on Hadoop Yarn that can execute complex directed acyclic graphs of general data processing tasks. In many ways it can be thought of as a more flexible and powerful successor of the map-reduce framework.

Here is a way to set Tez Environment Variable on hive

```
set hive.execution.engine=tez;
```

you can change back to MR

```
set hive.execution.engine=mr;
```

Please read further on this topic using your hive site. Hive on Tez is very much used in HDP version of Hadoop from Hortonworks.

Step-6. UDF

In this step, you will get familiar with writing a UDF using python.

Here is an example pseudo code:

Streaming.py code: (this is a sample code only; Please update as per your need)

```
import sys
from datetime import datetime
for line in sys.stdin.readlines():
boolVal = “false”
line = line.strip()
DATETIME = datetime.strptime(line, “%m/%d/%Y”)
print DATETIME
```

Next step, after writing the UDF code, you need to register in hive so that it can be used in your queries by using commands like :

```
add file streaming.py;
```

Here is a very good reference link for you:
http://spryinc.com/blog/guide-user-defined-functions-apache-hive

Now, you can use your UDF in your queries after your compile. Please read further on available udfs in Hive.

Questions/For your further reading/research:
Please use your reference materials like Apache site, Cloudera site for further research.

Q1: How would partitioning a table help?
Q2: Why buckets are created or used?
Q3: Using Hive on Tez feature, would it help?
Q4: What is a DAG?
Q5: Why do u need to register an UDF before using?
